This chapter outlines social cognitive treatment approaches for schizophrenia, including the roots of social cognitive treatments: proof of concept, social cognitive studies, targeted comprehensive and broad-based social cognitive treatments, including cognitive enhancement therapy (CET), integrated neurocognitive therapy (INT), metacognitive therapy (MCT), and social cognition (SC). Social cognitive schemata differ for boys and girls and are present as early as the findings are integrated and discussed in relation to future research design as well as preventative and interventional measures in the development of children’s physical and relational aggression.

Chapter I: Introduction

Social cognition encompasses a cognitive enhancement therapy (CET) Hogarty et al. (2004) is an intensive 18-month psychosocial cognitive rehabilitation program addressing social and non-social cognitive deficits through computerized neurocognitive remediation sessions with a peer and a coach and social cognitive rehabilitation groups. See Hogarty and Greenwald (2006).

Social neuroscience is the interdisciplinary field devoted to the study of neural, hormonal, cellular, and genetic mechanisms and the study of the associations and influences between social and biological levels of organization. The current handbook represents the first comprehensive review of contemporary research in the field. This introductory chapter begins with a brief background on social cognition.

Social cognition refers to thoughts and beliefs that individuals and groups hold concerning how and why people act as they do. The ability to interpret one’s own and other people’s actions in terms of internal and mental states that motivate human behavior is central to social cognition.
