The Liebowitz Social Anxiety Scale (LSAS) is a short questionnaire developed in 1987 by Michael Liebowitz, a psychiatrist and researcher at Columbia University and the New York State Psychiatric Institute. Its purpose is to assess the range of social interaction and performance situations feared by a patient in order to assist in the diagnosis of social anxiety disorder. A total of 392 undergraduate volunteers completed an online screening measure of the Social Interaction Anxiety Scale (SIAS) and one public speaking item from the Social Anxiety Scale (SAS). Mattick and Clarke (1998) validated the Social Interaction Anxiety Scale and the Social Phobia Scale across the anxiety disorders psychological assessment. Mattick and Clarke (1998) developed three alternative measures which were designed to assess social phobia specifically: the Pair of Measures called the Social Phobia Scale (SPS) and the Social Interaction Anxiety Scale (SIAS) Mattick and Clarke (1998), and the Social Phobia and Anxiety Inventory (SPAI) Turner et al. (1996). The factor structure of the Social Interaction Anxiety Scale and the Social Phobia Scale was examined by Thomas Heidenreich, Karin Schermelleh, Engelb Elisabeth Schramme, Stefan G. Hofmann, Ulrich Stangier, and colleagues. The widespread use of Mattick and Clarke’s (1998) Social Interaction Anxiety Scale (SIAS) and Social Phobia Scale (SPS) led two independent groups of researchers to develop short manuals for the Self-Perception Profile for Adolescents (SPPA). The Social Interaction Anxiety Scale and Social Phobia Scale are widely used measures of social anxiety using data from individuals with social anxiety disorder (N = 435) and non-anxious controls (N = 86). We assessed the psychometric properties of two independently developed short forms of these scales, indices of convergent and discriminant validity. In the chapter, the assessment list also includes the Beck Depression Inventory and the 1998 Mattick and Clarke Social Phobia Scale and Social Interaction Anxiety Scale. Many therapists will have alternative assessment instruments for depression other than the relatively expensive copyrighted Beck Inventory. For example, the Social Phobia and Anxiety Inventory (SPAI) Turner et al. (1989) was used as a self-report index of social phobia. The SPAI contains 32 social phobia items and 13 agoraphobia items. The total score minimum is 0. Social Interaction Anxiety Scale (SIAS) page 1 of 1: Instructions for each item, please circle the number to indicate the degree to which you feel the statement is characteristic or true for you. The rating scale is as follows: 0 not at all, 1 somewhat, 2 quite a bit, 3 extremely.
